

VÉLØ Oracle Prime — Strike Recommendations

Cheltenham Festival — Thursday, 12 March 2026

Report Generated: 2026-03-12 09:00 GMT | Engine Version:
VELO_ORACLE_PRIME_v10

1. Executive Summary

The VÉLØ Oracle Prime engine has processed the full 7-race card for the Cheltenham Festival on Thursday, 12 March 2026. The analysis resulted in **4 strike recommendations** and **3 quarantined races**.

The primary quarantine drivers were **Q9 (Conflicting Picks + High Chaos)** and **Q8 (Market Chaos)**, both triggered by large, competitive fields where expert data sources diverged. The GOOD ground across the card prevented any Q5 (Chaos Mode) quarantines, which would typically be a factor in softer conditions.

Two **HIGH** confidence strikes have been identified in small-field Grade 1 events where strong consensus and market support align. One **MEDIUM** confidence strike was found where data consensus overcame large-field uncertainty, and one **LOW** confidence strike was identified by leveraging the RPD-C model to find value against conflicting data.

Metric	Value
Total Races Processed	7
Total Strikes Issued	4
Total Quarantined Races	3 (43%)
HIGH Confidence Strikes	2
MEDIUM Confidence Strikes	1
LOW Confidence Strikes	1

2. Priority Strikes (HIGH Confidence)

These represent the strongest opportunities on the card, where data consensus, market stability, and race dynamics align for maximum confidence.

Race 5 (4:00) — Ryanair Chase (Grade 1)

- **TOP STRIKE: Fact To File**
- **Confidence: HIGH**
- **Chaos Rating:** $\frac{1}{5}$ (Low)
- **Consensus:** YES (Postdata & Topspeed)
- **Rationale:** The engine confirms the overwhelming evidence. As the defending champion with a dominant recent win in the Irish Gold Cup, **Fact To File** holds a T-Tag with 7 positive signals. With full consensus from data partners, a very short price ($\frac{8}{11}$), and a low-chaos race profile, this is the highest-confidence strike of the day.

Race 3 (2:40) — Close Brothers Mares' Hurdle (Grade 1)

- **TOP STRIKE: Take No Chances**
- **Confidence: HIGH**
- **Chaos Rating:** $\frac{1}{5}$ (Low)
- **Consensus:** YES (Postdata & Topspeed)

- **Rationale:** This is a pure data-driven strike. Despite the spotlight favouring Wodhooh, the VÉLØ engine places its highest confidence in **Take No Chances**, who is the consensus pick for both Postdata and Topspeed. In a small field with very low chaos, this data alignment is a powerful signal that overrides the market favourite. All top contenders (Wodhooh, Jade De Grugy, Take No Chances) carry T-Tags, but the data consensus is the deciding factor.
-

3. Secondary Strike (MEDIUM Confidence)

This is a solid opportunity where data consensus provides a clear edge, despite some minor uncertainty from other factors.

Race 7 (5:20) — Kim Muir Challenge Cup

- **TOP STRIKE:** Monbeg Genius
 - **Confidence:** MEDIUM
 - **Chaos Rating:** $\frac{4}{5}$ (High)
 - **Consensus:** YES (Postdata & Topspeed)
 - **Rationale:** The engine issues a strike despite the high chaos rating ($\frac{4}{5}$) due to the strong **data consensus** for **Monbeg Genius**. Both Postdata and Topspeed align on this horse, which is a significant signal in a large-field handicap. While the Spotlight selection points elsewhere, the engine's doctrine prioritizes data consensus as a foundational truth. The horse carries a T-Tag with 4 positive signals, confirming its profile as a target.
-

4. Tertiary Strike (LOW Confidence)

This is a value-oriented opportunity where the engine has identified a strong underlying profile that may be overlooked by surface-level analysis.

Race 4 (3:20) — Paddy Power Stayers' Hurdle (Grade 1)

- **TOP STRIKE:** Honesty Policy
- **Confidence:** LOW
- **Chaos Rating:** $\frac{2}{5}$ (Low)

- **Consensus:** NO
- **Rationale:** This is a classic VÉLØ value play. With conflicting data picks (Postdata: Home By The Lee, Topspeed: Impose Toi), the engine defaults to the RPD-C model to find the strongest profile. **Honesty Policy** is the Spotlight selection and carries a T-Tag with 4 strong positive signals, including being a lightly raced 6yo with significant potential. The engine identifies this as the most likely winner despite the lack of data consensus, making it a confident low-confidence strike.

5. Quarantined Races

The VÉLØ engine has **refused to issue a strike recommendation** in the following races due to unacceptably high uncertainty.

Race	Time	Title	Gate	Reason
1	1:20	Ryanair Mares' Novices' Hurdle	Q9	Conflicting Picks + High Chaos ($\frac{4}{5}$). In a massive 22-runner field, Postdata selected Bambino Fever while Topspeed chose Carrigmoornaspruce. This lack of consensus in a high-chaos environment makes the race unpredictable.
2	2:00	Jack Richards Novices' Hcap Chase	Q8	Market Chaos. The favourite, Regent's Stroll, is priced at 4.5 ($\frac{9}{2}$), which is above the 4.0 threshold for a stable favourite. This indicates significant market uncertainty and a lack of a clear, reliable anchor for the race.
6	4:40	Pertemps Network Final	Q9	Conflicting Picks + High Chaos ($\frac{4}{5}$). Another large-field handicap (24 runners) with divergent expert opinion (Postdata: Bold Endeavour, Topspeed: Electric Mason). The engine correctly identifies this as a high-risk environment and quarantines the race.

6. SIGMA-Ready Data & Key Insights

- **Full JSON predictions** for all 7 races, including RPD-C tables and runner-level data, have been generated and are ready for post-race SIGMA analysis.

- **Insight 1: Good Ground is Key.** The absence of soft or heavy going was the single biggest factor in preventing more quarantines. The Q5 gate was never a threat, allowing the engine to focus on data conflicts and market signals.
- **Insight 2: Consensus Overcomes Chaos.** The strike on Monbeg Genius (Race 7) demonstrates the engine's ability to trust data consensus even in a high-chaos ($\frac{4}{5}$) environment. This will be a key area for SIGMA review.
- **Insight 3: RPD-C Finds Value.** The strike on Honesty Policy (Race 4) shows the power of the RPD-C tagging system to identify the strongest underlying horse profile when top-line data is conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. conflicting. This is a crucial function for finding value.
